Look out for bright yellow bird's-foot trefoil and the purple thistle-like flowers of common knapweed, amongst many other wildflowers. These flowers provide nectar for butterflies such as meadow brown and common blue. **Woodlands** Strips of woodland were planted around Common blue on Cambourne to provide food bird's-foot trefoil and shelter for wildlife and a pleasant area to walk through. See if you can spot hawthorn, hazel, alder, willow and field maple.

Great crested newt

## Grassland

Lakes and Ponds

The lakes in Cambourne were created to collect excess water from the town during heavy rain to prevent flooding, but they also provide a great place for lots of wildlife, especially birds such as coot. If you visit in the early morning you may be lucky and see a kingfisher, heron or cormorant fishing.

# The Wildlife Trust in Cambourne

Formerly farmland, the new parish of Cambourne was born in the 1990s from a visionary approach to planning development sensitively around wildlife and the natural environment.

The Wildlife Trust assisted from the start, helping develop a 'green infrastructure' which retained natural features such as woodlands, hedges and ponds as well as identifying suitable places for the creation of new habitat networks which the town could be built around.

These 'wild' spaces now form a 95 hectare (235 acres) nature reserve, interwoven around the town, which we look after, ensuring they continue to be good wildlife habitats.

# 'Wild' residents

Cambourne now supports more wildlife than the surrounding land, and is home to some rare species protected by law. Great crested newts lay their eggs in the ponds. Water voles use the lakes and ditches. Skylarks and other farmland birds love the meadows. The wild flowers around the site provide nectar for butterflies to feed on. If you walk around the site quietly you may be lucky enough to spot some of them.

# **Cambourne Wild Discovery Trail**

This 1.5km trail loops south from Oaks Wood car park, followed by a loop to the north. There are information boards along the trail to tell you more about the different areas of the nature reserve and the wildlife that lives in them. It should take about 20 minutes to

Management involves cutting the grass and hedges at the right time of year, maintaining the paths and ditches and monitoring what is happening to the wildlife as the nature reserve develops.
